Did you know?
In every medical discipline, unanswered questions exist about health conditions that affect men and women differently. Research can help all people get better, individualized care.

What is the Illinois Men’s Health Registry?
The Registry is a gateway for men who are interested in participating in clinical research studies being conducted across Illinois. Registrants complete a health survey so they can be matched based on their profile to on-going studies at Northwestern and other academic institutions.

Why should I enroll?
• To gain access to groundbreaking research studies and clinical trials.
• To help researchers learn more about the factors that affect men’s health so they can better assess and tailor new treatments.
• To help improve the prevention and treatment of certain diseases and health conditions prevalent in men.

Is it confidential?
Yes, absolutely. We utilize the same level of security used for banking and healthcare websites. Your information is never given to a physician, insurance company, vendor, etc.

What will happen with my data?
The de-identified data can be used to find men who match eligibility requirements of current research studies and clinical trials. If men who match are interested, they will be invited to participate in approved studies that advance men’s health.

Who is sponsoring the Registry?
The Registry was developed and is sponsored by the Women’s Health Research Institute at Northwestern University. The Institute is dedicated to identifying sex differences that advance health in all people.

Help advance men’s health in Illinois by joining the Registry:
